

Ace Ohlsson Equine Blend

A perennial blend designed for our equine partners provides both winter and summer. This blend gives your horse or horses a balanced diet of both grasses and legume species. These species maximise the performance of the pastures without compromising your horse's health.

Before sowing your new equine pasture, it is best to talk to our agronomy team about the preparation of your paddock prior to sowing. This includes soil testing for available nutrients and what actions are required to establish your new pastures quickly.

The general sowing rate for this blend is **25 kg per Ha or 2.47 Acres** along with a starter fertilizer such as CK 88 or Croplift 15. We also recommend sound grazing management practices and maintenance fertilizer program using Pasture Boosta or similar to maximise the performance of your equine pastures.
