

Ace Ohlsson Hawkesbury Blend

A robust perennial blend which provides both winter and summer feed for your livestock. This blend gives your livestock a balanced diet of both grasses and legume species, which maximises the performance of the pastures on your property all year round.

Before sowing your new pasture, it is best to talk to our agronomy team about the preparation of your paddock or paddocks prior to sowing. This includes soil testing for available nutrients and what actions are required to establish your new pasture quickly.

The general sowing rate for this blend is **25 kg per Ha or 2.47 Acres** along with a starter fertilizer such as CK88 or Croplift 15. We recommend sound grazing management practices and a maintenance fertilizer program using Pasture Boosta or similar maximise the performance of your pastures.
